CIRCUIT DESCRIPTION

NON-SWITCHING CIRCUIT

Generally, power amplifiers are designed to operate in class B so that a high efficiency can be obtained. However, transistor amplifiers operated other than in class A cause the switching distortion and crossover distortion.

The crossover distortion is caused when a small signal is amplified in the nonlinear input /output characteristics range of a class B push-pull amplifier.

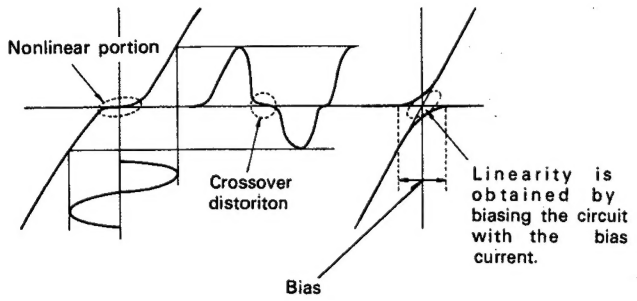

Fig. 1 Crossover distortion

The signal distortion due to the nonlinear amplification is called the crossover distortion, and it can be eliminated by biasing the circuit with the bias current so as the amplifier operates like that of class AB.

The switching distortion is caused by the delay of the switching operation of a transistor pair used in a class B push-pull amplifier.

The output stage of a power amplifier is, generally, connected in SEPP mode.

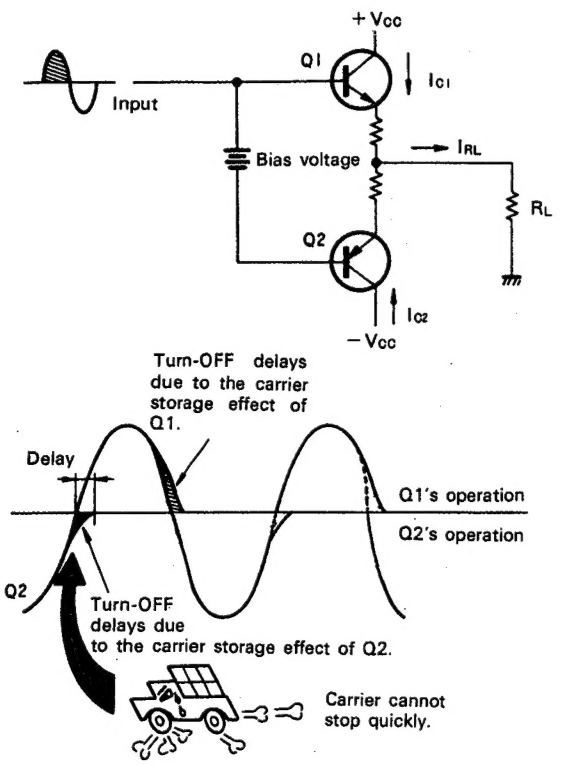

Fig. 2 Switching distortion

In figure 2, when an alternating signal is applied to the input, Q1 turns ON and Q2 is cut OFF in the positive half cycle; conversely, Q1 is cut OFF and Q2 turns ON in the negative half cycle. However, switching of conduction from Q1 to Q2, and vice versa, is not smooth because of the carrier storage effect.

Assuming that the input signal makes a transition from negative to positive, the Q1 turns ON immediately according to the input signal. However, the Q2 is not cut off immediately due to the carrier storage effect. The Q1 is already conducting a large current when the Q2 is completely cut off. This situation is also identical for a transition from positive to negative.

A non-switching amplifier reduces the distortion due to the carrier storage effect by conducting a current even through the OFF side transistor.

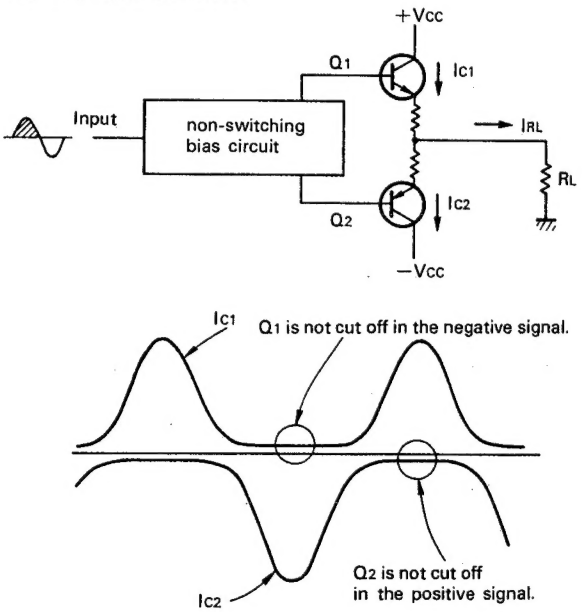

Fig. 3 Non-switching amplifier

The following figure shows the basic circuit diagram of KA-400 power amplifier.

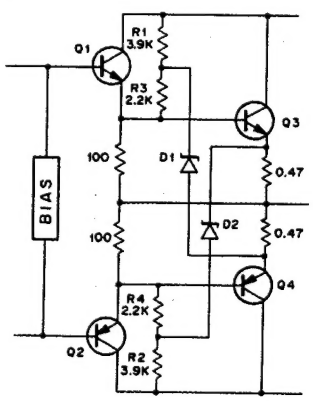

Fig. 4 Basic circuit diagram of KA-400, power amplifier

CIRCUIT DESCRIPTION

Transistors Q1 and Q2 are the drivers, and Q3 and Q4 are power transistors. Zener diodes D1 and D2, having the zener voltage of 14V, make up the non-switching bias circuit together with resistors R1 through R4. Assuming a conventional class B power amplifier, when a positive signal is input, Q1 and Q3 turn ON and Q2 and Q4 are cut off. However, in the present circuit, Q4 is not cut off since it is biased through R2, R4 and D2. Similarly, when a negative signal is input, Q3 is not cut off since it is biased through R1, R3 and D1. This operation is further explained by the following figure.

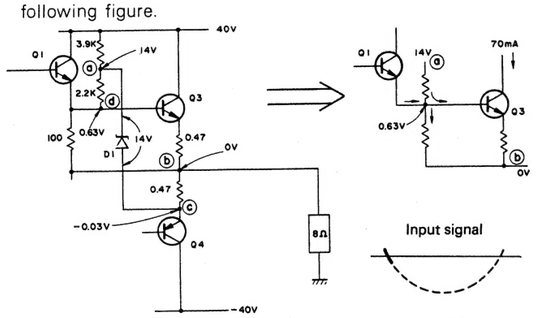

Fig. 5 Input signal goes from positive to negative

At the time when the input signal voltage goes from positve to negative ① (**Fig. 8**), the driver transistor Q1 is conducting a collector current and the zener diode D1 is also in active to produce 14V at point ⓐ . A part of the Q1's emitter current and a current from point a through the resistor are supplied to the base of the power transistor Q3 as a bias current. Then Q3's collector current will be approximately 70 mA.

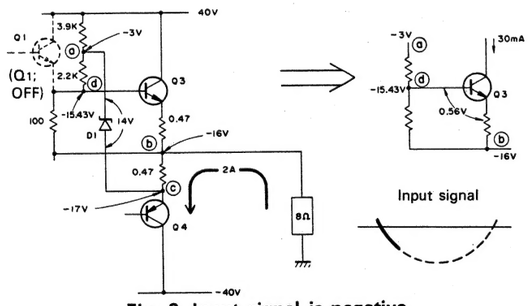

Fig. 6 Input signal is negative

The above figure shows the states of the circuit when the input signal is negative ② (**Fig. 8**) and the Q4's collector current is 2A. Since ② ampered flows through the 8-ohm resistor, the voltage at point ⓑ becomes −16V.
Most of this current flows through the emitter resistor of Q4, making −17V at point ⓒ . The voltage at point ⓐ is higher than that of point ⓒ by 14V which is the zener voltage of D1, thus resulting in the point ⓐ voltage at −3V. At this time, Q1 is cut off, and the voltage at point ⓓ is −15.43V which is the difference of voltages at points ⓐ and ⓑ divided by resistors of 2.2 kΩ and 100Ω.
Now, let's examine the operation of transistor Q3 referring to the voltages at points ⓐ through ⓓ . The base-emitter voltage VBE of Q3 is 0.56V (see **Fig. 5, 6** and **7**), thus the Q3 is not cut off. The Q3's collector current will be about 30 mA, which is reduced from the initial 70 mA.

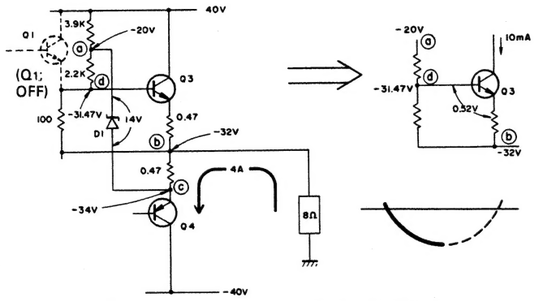

Fig. 7 Input signal is more negative

When the signal voltage becomes larger in negative ③ (**Fig. 8**), the voltage drop accross the Q4's emitter resistor increases, resulting in a reduction of Q3's VBE. Thus the collector current further decreases to become about 10 mA, but the Q3 will never be cut off. The following figure shows the voltage of various points in the circuit in relative to the time.

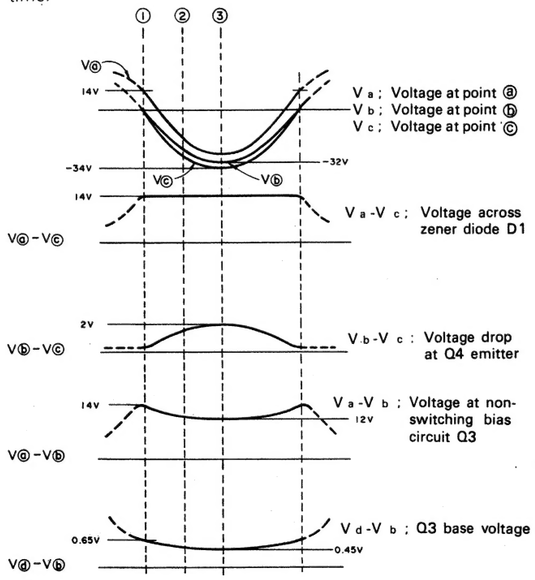

Fig. 8

The behavior of power transistor Q4 with a positive output signal is identical with the operation of Q3 for a negative output, as explained above. Thus, power transistors Q3 and Q4 are not cut off in any case, and the switching distortion by carrier strage effect is reduced. In the actual circuit, a thermistor is connected between the bases of Q1 and Q2, in order to prevent the over-driving of Q3 and Q4 when the ambient temperature rises.

DISASSEMBLY FOR REPAIR

AUDIO AMP PC BOARD ASS'Y

1. Detach the bottom plate Ⓑ from Ⓐ using a cutter.

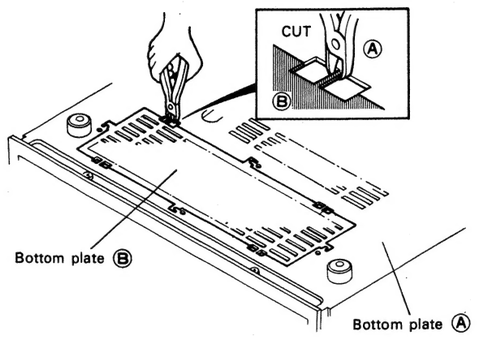

Fig. 1

2. Turn the bottom plate Ⓑ 180° as shown.

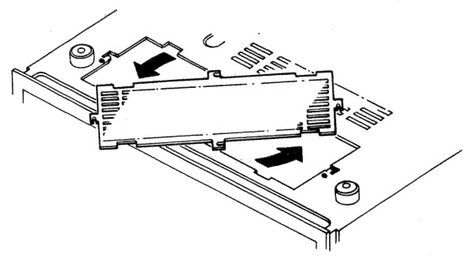

Fig. 2

3. Attach the bottom plate Ⓑ with screw as shown.

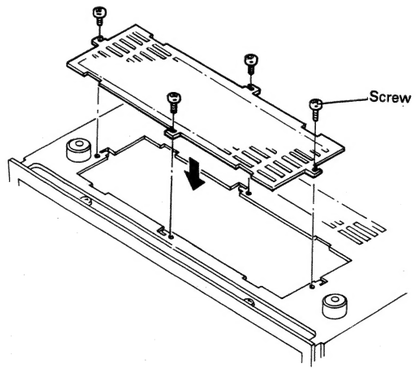

Fig. 3

POWER TRANSISTOR

1. Unsolder twelve pins from connection P.C. board.

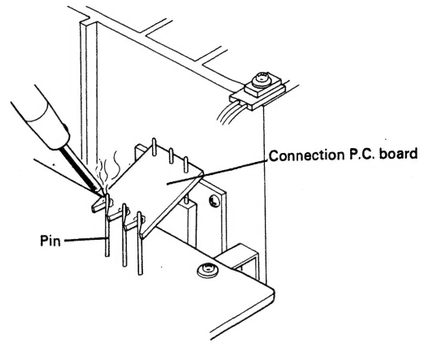

Fig. 4

2. Remove four screws Ⓐ on the heat sink.
   Remove four screws Ⓑ fixing the heat sink.

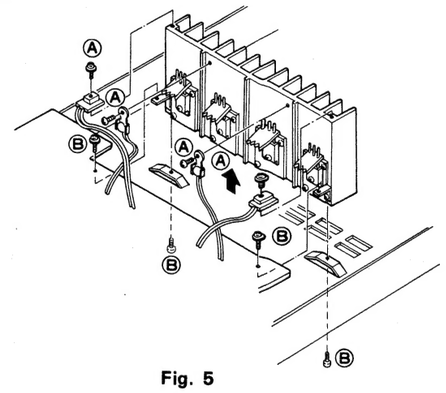

Fig. 5

3. Remove the defective transistor from heat sink Ⓑ .
4. Paint thermal compound on the heat sink Ⓑ where a new transistor is to be mounted.
5. Mount a new transistor on the heat sink Ⓑ

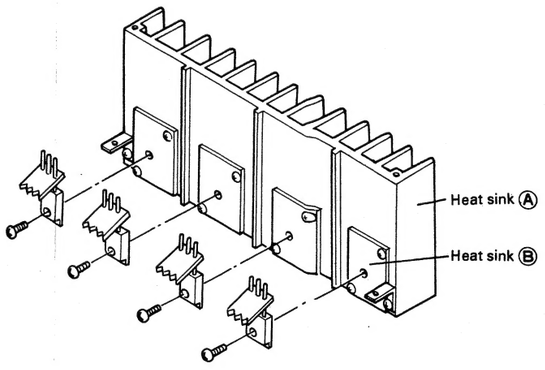

Fig. 6

KA-400 KA-400

ADJUSTMENT/RÉGLAGES/ABGLEICH

1. POWER AMP OFFSET VOLTAGE ADJUSTMENT

1. Connect the DC voltmeter between the positive and negative speaker terminals.
2. Adjust the trimming pot VR7 (VR8) for a 0V reading of the DC voltmeter.

1. RÉGLAGE DE LA TENSION DE DECALAGE (OFFSET)

1. Brancher le voltmètre de c.c. aux bornes de sortie + et −.
2. Régler le potentiomètre ajustable VR7 (VR8) pour que la tension de sortie soit nulle.

1. OFFSET-SPANNUNG DER ENDVERSTÄRKER

1. Den Gleichspannungsmesser zwischen den Lautsprecherklemmen + und − der endverstärker anschließen.
2. Die Regelstange durch das Unterplattenloch einführen und den halbeingebetteten Widerstand VR7 (VR8) so regulieren, daß die Gleichspannungsmesser-Ablesung 0V ist.

2. BIAS CURRENT ADJUSTMENT

1. Turn the volume control knob fully counterclockwise.
2. Connect the DC voltmeter between the adjusting points ❶ and ❸ (❷ and ❹) of audio amp pc board ass'y (X09-145).
3. Adjust the BIAS CURRENT trimming pot VR5 (VR6), for a 70 mV reading of the voltmeter.

2. RÉGLAGE DU COURANT DE POLARISATION

1. Tourner le bouton de commande de volume à fond dans le sens invers de celui des aiguilles d'une montre.
2. Brancher le voltmètre de c.c. aux points d'alignment, ❶ et ❸ (❷ et ❹), sur la plaque circuit imprimè d'ampli de puissance (X09-145).
3. Réguler le potentiomètre ajustable VR5 (VR6) de façon à ce que le voltmètre de c.c. indique 70 mV.

2. LEERLAUFS

1. Den Lautstärkeregler (VOLUME) drehen um die Leistungsverstärker-Aufnahme auf Null zu reduzieren.
2. Den Gleichspannungsmesser zwischen der Regulierungs-Punkte ❶ und ❸ (❷ und ❹) der endverstärker anschließen.
3. Den halbeingebetteten Widerstand VR5 (VR6) der Leistungsverstärker so regulieren, daß die Gleichspannungs-messerAblesung 70 mV ist.

3. PEAK POWER LEVEL INDICATOR ADJUSTMENT

1. Connect an AG and dummy load to Aux jack and speaker terminal respectively.
2. Connect an AC voltmeter across the dummy load.
3. Set the AG to 1 kHz and its output for a 5.6V reading of the AC voltmeter.
4. Adjust the trimming pot. VR9 (VR10) so that the 4 LEDs (for 0.004, 0.04, 0.4 and 4) light.

3. REGLAGE DU "PEAK POWER LEVEL"

1. Relier un AG (générateur de signaux audio) sur les prises Aux et une fausse charge (Resistance) sur les bornes de haut-parleir.
2. Relier un voltmètre aux deux extrémités de la resistance (ou aux borne de sortie + et −).
3. Journer le potentiomètre d'AG et d'ampli en sortie que un voltmètre indique 5,6V.
4. Régler le potentiomètre adjustable VR9 (VR10) en sortie que les 4LEDs (0,004, 0,04, 0,4 et 4W) allument.

3. PEGELEINSTELLUNG DES "PEAK POWER LEVEL" INDIKATOR

1. Einen AG (NF-Signalgenerator) an die AUX-Buchsen und eine kunstliche Last (8Ω 100W order mehr) an die Lautsprecher-Anschlüsse anschließen.
2. Einen Wechselestrom-Voltmeter über die künstliche Last anschliessen.
3. Den AG auf 1 kHz einstellen. Die Lautstärke regler (oder den AG-Ausgang) so einstellen, daß Votmeter 5,6V anzeigt.
4. Das Trimme-Potentiometer VR9 (VR10) so einstellen, daß die 4 LEDs (für 0,004, 0,04, 0,4 und 4) leuchten auf.

INSTRUCTION FOR PARTS LIST

Ref. No. 参照番号	Parts No. 部品番号	Description 部品名／規格	Remarks 備考
18 1A	A01-0608-12	METALLIC CABINET	*
19 2A	A20-1979-11	FRONT PANEL ASSY	*K
19 2A	A20-1979-11	FRONT PANEL ASSY	PM
19 2A	A20-1979-11	FRONT PANEL ASSY	SU
19 2A	A20-1979-11	FRONT PANEL ASSY	XW
R221	R43-1333-15	FL-PROOF RD330 J 2H	*
R222	R43-1368-15	FL-PROOF RD680 J 2H	*
VR1 ,2	R12-3301-05	TRIMMING POT, 20K(B)	
VR3 ,4	R19-4305-05	POTENTIOMETER (OUTPUT)	*
VR5 ,6	R12-2302-05	TRIMMING POT, 5K(B)	

① Exploded view drawing No.
② Position in exploded view.
③ Symbol of new parts.
④ Area to which parts are shipped. Example: A20-1979-11 is the parts No. of FRONT PANEL ASSY for the "K" type products (for USA).
When this column is blank, it means that the same type of parts (same parts No.) are used for the products shipped to all areas.
⑤ Reference No. in schematic diagram.
⑥ Abbreviation of "Flame proof metal oxide film resistor". All capacitors and resistors are listed using abbreviations.
⑦ Abbreviations

* Abbreviations of capacitors (Parts No. with initial letter "C").
ELECTRO ..... Electrolytic capacitor
LL-ELEC ..... Low leak electrolytic capacitor
NP-ELEC ..... Non-pole electrolytic capacitor
MICA ..... Mica capacitor
POLYSTY ..... Polystyrene capacitor
MYLAR ..... Mylar capacitor
CERAMIC ..... Ceramic capacitor
TANTAL ..... Tantalum capacitor
MF ..... Metallized film capacitor
OIL ..... Oil capacitor
The unit "UF" is used in lieu of "μF".

* Abbreviations of resistors (Parts No. with initial letters "R").
RC ..... Carbon composition resistor
RD ..... Carbon film resistor
FL-PROOF RD ..... Flame-proof carbon film resistor
RW ..... Wire wound power resistor
FL-PROOF RS ..... Flame-proof metal oxide film resistor
RN ..... Metal film resistor
FUSE-RESIST ..... Resistor with fuse function
2B ..... Rated wattage 1/8W
2E ..... Rated wattage 1/4W
2H ..... Rated wattage 1/2W
3A ..... Rated wattage 1W
3D ..... Rated wattage 2W
3F ..... Rated wattage 3W
3G ..... Rated wattage 4W
3H ..... Rated wattage 5W
All resistor values are indicated with the unit (Ω) omitted.

* Abbreviations common to capacitors and resistors.
C ..... ±0.25pF (Used for capacitors only)
D ..... ±0.5pF (Used for capacitors only)
F ..... ±1%
G ..... ±2%
J ..... ±5%
K ..... ±10%
M ..... ±20%
Z ..... +80%, −20% (Used for capacitors only)
P ..... +100%, −0% (Used for capacitors only)

⑧ Resistors RD (carbon composition resistors) are not listed in the parts list. For values, refer to the schematic diagram.

A product of
TRIO-KENWOOD CORPORATION
6-17, 3-chome, Aobadai, Meguro-ku, Tokyo 153, Japan

KENWOOD ELECTRONICS, INC.
1315 E. Watsoncenter Rd, Carson, California 90745, U.S.A.
75 Seaview Drive, Secaucus, New Jersey 07094, U.S.A.
1098 North Tower Lane Bensenville, Illinois 60106, U.S.A.
TRIO-KENWOOD ELECTRONICS, N.V.
Leuvensesteenweg 504 B-1930 Zaventem, Belgium
TRIO-KENWOOD ELECTRONICS GmbH
Rudolf-Braas-Str. 20, 6056 Heusenstamm, West Germany
TRIO-KENWOOD FRANCE S.A.
5, Boulevard Ney, 75018 Paris, France
TRIO-KENWOOD SVENSKA AB
Kemistvagen 10A, S-183 21 Taby, Sweden
TRIO-KENWOOD (AUSTRALIA) PTY. LTD.
30 Whiting St., Artarmon, N.S.W. 2064, Australia
KENWOOD & LEE ELECTRONICS, LTD.
Room 501, Wang Kee Building, 5th Floor, 34-37, Connaught Road, Central, Hong Kong
